FOR IMMEDIATE RELEASE

BIOXCLUDE™: THE BIRTH OF A NATURAL, BIORESORBABLE MEMBRANE

The First of its Kind, A Natural Membrane Made From Processed Amnion and Chorion Tissue; Introduced to the Dental Market by Regenerative Product Company – Snoasis Medical, Inc.

Denver, Colorado, March 15, 2010 – Snoasis Medical, Inc. introduces BioXclude, a processed, dehydrated and terminally sterilized graft composed of human amnion and chorion tissue. BioXclude represents the first allograft sourced from donated placental tissue for use as a wound covering in guided bone regeneration procedures. Distribution of BioXclude commenced this past weekend at the Academy of Osseointegration in Orlando, March 4-6, 2010. BioXclude is the second product from Snoasis Medical, a dental company based out of Denver, Colorado.

The dental regenerative market is continually evolving from scientific innovations that are aimed at improving outcomes and predictability, while lessening complications from surgical protocols. According to Robert Tofe, president and founder of Snoasis Medical, “The inherent qualities of donated placental tissue are truly amazing. Using both parts of the amniotic sac has allowed Snoasis to introduce a product that possesses the necessary thickness to be suitable for use as a wound covering in guided bone regeneration procedures. As we continue to learn about the scientific merits of placental tissue, Snoasis will continue to develop new products to address the unmet needs of the dental market...BioXclude is no exception.”

Mark Lucas, DDS, MS of Denver, CO, is one of a handful of clinicians who participated in the clinical evaluation of BioXclude. While using the material for ridge augmentations and extraction sockets, Dr. Lucas found BioXclude to be, “Easy to use as the material is placed dry and conforms to the surgical site, eliminating the need for sutures to keep it in place. Precise trimming is not required as the material adapts easily to the graft site, and all cases demonstrated a high quality of new bone upon reentry, with minimal swelling and inflammation soon after the graft surgery.”

Founded in 2007, Snoasis Medical is focused on the development and commercialization of products for use in dental regenerative procedures. It is the exclusive distributor for all current and future products manufactured by its partner, Surgical Biologics (Kennesaw, GA). Snoasis Medical’s first product, BioCover™, is made from the amnion portion of the placenta and is designed for use as a wound covering in the treatment of gingival recession. This product has been available for sale since early 2009. In addition to its line of placental tissue based products, Snoasis Medical is developing technology licensed from The University of Colorado Health Sciences Center. The technology is focused on a novel, low cost growth factor product which utilizes a natural source of growth factors,

rather than recombinant technology, dramatically lowering manufacturing costs. For additional information on all of Snoasis Medical's products, please visit www.SnoasisMedical.com.
